آدرس دهی بیتی

- Many μ P allow programs to access registers in byte size only!
 - To check a single bit
 - Read the entire byte
 - Manipulate the byte with logic instructions
- This is not the case with AVR
 - Bit-addressability options of AVR family

SBR – Set Bits in Register

Manipulating bits of GPR

- Sets specified bits in register Rd.

Operation:

- (i) $Rd \leftarrow Rd \vee K$

Syntax:

- (i) SBR Rd,K

Operands:

$16 \leq d \leq 31, 0 \leq K \leq 255$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

| | | | |
|------|------|------|------|
| 0110 | KKKK | dddd | KKKK |
|------|------|------|------|

Status Register (SREG) and Boolean Formula

CBR – Clear Bits in Register

Manipulating bits of GPR

- Clears the specified bits in register Rd.

Operation:

$$(i) \quad Rd \leftarrow Rd \cdot (\$FF - K)$$

Syntax:

(i) CBR Rd,K

Operands:

$$16 \leq d \leq 31, 0 \leq K \leq 255$$

Program Counter:

$$PC \leftarrow PC + 1$$

16-bit Opcode:

| | | | |
|------|------|------|------|
| 0111 | KKKK | dddd | KKKK |
|------|------|------|------|

BST – Bit Store from Bit in Register to T Flag in SREG

- Stores bit b from Rd to the T Flag in SREG (Status Register). T → Temporary

Operation:

(i) $T \leftarrow Rd(b)$

Syntax:

(i) BST Rd,b

Operands:

$0 \leq d \leq 31, 0 \leq b \leq 7$

Program Counter:

$PC \leftarrow PC + 1$

16-bit Opcode:

BLD – Bit Load from the T Flag in SREG to a Bit in Register

- Copies the T Flag in the SREG (Status Register) to bit b in register Rd.

Operation:

(i) $Rd(b) \leftarrow T$

Syntax:

(i) BLD Rd,b

Operands:

$0 \leq d \leq 31, 0 \leq b \leq 7$

Program Counter:

$PC \leftarrow PC + 1$

16 bit Opcode:

SBRC – Skip if Bit in Register is Cleared

- This instruction tests a single bit in a register and skips the next instruction if the bit is cleared.

(i) If $Rr(b) = 0$ then $PC \leftarrow PC + 2$ (or 3) else $PC \leftarrow PC + 1$

Syntax:

Operands:

Program Counter:

(i) SBRC Rr,b

$0 \leq r \leq 31, 0 \leq b \leq 7$

$PC \leftarrow PC + 1$, Condition false - no skip

Words 1 (2 bytes)

Cycles 1 if condition is false (no skip)

2 if condition is true (skip is executed) and the instruction skipped is 1 word

3 if condition is true (skip is executed) and the instruction skipped is 2 words

$PC \leftarrow PC + 2$, Skip a one word instruction

$PC \leftarrow PC + 3$, Skip a two word instruction

16-bit Opcode:

| | | | |
|------|------|------|------|
| 1111 | 110r | rrrr | 0bbb |
|------|------|------|------|

SBRS – Skip if Bit in Register is Set

- This instruction tests a single bit in a register and skips the next instruction if the bit is set.

(i) If $Rr(b) = 1$ then $PC \leftarrow PC + 2$ (or 3) else $PC \leftarrow PC + 1$

Syntax:

Operands:

Program Counter:

(i) SBRS Rr, b

$0 \leq r \leq 31, 0 \leq b \leq 7$

$PC \leftarrow PC + 1$, Condition false - no skip

Words 1 (2 bytes)

Cycles 1 if condition is false (no skip)

2 if condition is true (skip is executed) and the instruction skipped is 1 word

3 if condition is true (skip is executed) and the instruction skipped is 2 words

$PC \leftarrow PC + 2$, Skip a one word instruction

$PC \leftarrow PC + 3$, Skip a two word instruction

16-bit Opcode:

| BRBC s,k | Branch if Bit s in status register is Cleared |

BRBC – Branch if Bit in SREG is Cleared

- Conditional relative branch. Tests a single bit in SREG and branches relatively to PC if the bit is cleared. This instruction branches relatively to PC in either direction ($PC - 63 \leq \text{destination} \leq PC + 64$). Parameter k is the offset from PC and is represented in two's complement form.

(i) If $SREG(s) = 0$ then $PC \leftarrow PC + k + 1$, else $PC \leftarrow PC + 1$

Syntax:

Operands:

Program Counter:

(i) BRBC s,k

$0 \leq s \leq 7, -64 \leq k \leq +63$

$PC \leftarrow PC + k + 1$

$PC \leftarrow PC + 1$, if condition is false

- The internal RAM is not bit-addressable
- In order to manipulate a bit of internal RAM location
 - Bring it into GPR and manipulate

Write a program to see if the internal RAM location \$195 contains an even value. If so, send it to Port B. If not, make it even and then send it to Port B.

```
.EQU MYREG = 0x195           ;set aside loc 0x195
    LDI R16,0xFF
    OUT DDRB,R16             ;make Port B an output port
AGAIN:LDS R16,MYREG
    SBRS R16,0               ;bit test D0, skip if set
    RJMP OVER                ;it must be LOW
    CBR R16,0b00000001       ;clear bit D0 = 0
OVER: OUT PORTB,R16          ;copy it to Port B
    JMP AGAIN                ;we can use RJMP too
```

ماکروها

- A group of instructions performs a task
 - Used repeatedly
- Does not make sense to rewrite this code every it is needed

Macros

- Macros allow
 - To write the task once only, and to invoke it whenever it is needed
 - Reduce the time to write code and possibility of errors

تعريف ماكروها

- Macro definition

- A macro can take up to 10 parameters
 - Parameters can be referred to as @0 to @9
- After the macro has been written, it can be invoked by its name

ماکروها

نحوه استفاده

For example, moving immediate data into I/O register data RAM is a widely used service, but there is no instruction for that. We can use a macro to do the job as shown in the following code:

```
.MACRO      LOADIO
            LDI    R20, @1
            OUT    @0, R20
.ENDMACRO
```

The following are three examples of how to use the above macro:

1. `LOADIO PORTA, 0x20` ;send value 0x20 to PORTA
2. `.EQU VAL_1 = 0xFF`
`LOADIO DDRC, VAL_1`
3. `LOADIO SPL, 0x55` ;send value \$55 to SPL

ماکروها

نحوه استفاده

Assume that several macros are used in every program. Must they be rewritten every time? The answer is no, if the concept of the `.INCLUDE` directive is known. The `.INCLUDE` directive allows a programmer to write macros and save them in a file, and later bring them into any program file. For example, assume that the following widely used macros were written and then saved under the filename `"MYMACRO1.MAC"`.

```
toggling Port B using macros
.INCLUDE "M32DEF.INC"
.INCLUDE "MYMACRO1.MAC" ;get macros from macro file
;-----program starts
        .ORG 0
        LOADIO  DDRB,0xFF
L1:      LOADIO  PORTB,0x55
        DELAY   R18,0x70
        LOADIO  PORTB,0xAA
        DELAY   R18,0x70
        RJMP    L1
```

پایان

موفق و پیروز باشید
